Lngani*, *G. Forbesi*, and *G. gracilis*, many of the plates have re-entering angles, but in their arrangement in the walls of the cup they form regular series. The pectinated rhombs also exhibit some peculiar new features. In no other genus have more than three been observed, and these, in all the genera except *Echino-encrinites*, are placed one at the base of the dorsal side and two in the upper half of the body, as in the genus *Pleurocystites*. The surface of *Glyptocystites* shews that three is not the constant number. It was also supposed to be essential to these organs that each should occupy two contiguous plates, about half of the rhomb being upon one and the other half upon the other. In *Glyptocystites* we have the new character of-half rhombs in all the four species. Generic name...
